Bay Area Local Jurisdictions
Parking Technology Roundtable

December 8, 2014, 10am -2pm

New parking technologies offer advantages in implementing local parking policies and managing parking to improve our communities. Technology can be used to support parking information, payment, and enforcement systems. But the technologies are new and changing quickly, including both hardware and software innovations, making it challenging to determine how to proceed.

This session is designed to share information, experiences, and questions among local jurisdictions, including cities, counties and transit agencies. This will be a roundtable format with scheduled presentations from several local cities that have recently evaluated and/or implemented various parking technologies, and plenty of time for questions, discussion and sharing of experiences from all the local jurisdictions.

Some of the issues to be discussed include:

- What are the policy concerns in adopting new parking technologies?
- How can local jurisdictions define their needs in a way that will lead to selecting the best technologies for their purposes?
- What are the tradeoffs between parking occupancy collection techniques?
- How can parking technology best support the sharing of parking information?
- What have been the experiences with smart meters (single and multi-head), including installation and management? What financing approaches make sense?
- What are the advantages and disadvantages of various customer payment systems?
- Which enforcement systems best serve your policy goals?
- What political or institutional impediments have arisen; what are ideas for addressing them?

Please join us for an engaging session.

RSVP by Nov. 24 to Janice Richards at Jrichards@mtc.ca.gov
Space is limited: details will be provided to registrants
